Contribution Document

We split the work into different parts, but we worked on the notebook together as a group. We ran the code one section at a time, taking turns executing cells and checking the output together before moving on, so everyone understood what each step did rather than doing everything solo. At the end, we also did the questions together for better collaboration and to answer the questions effectively.

Brian Contribution: My group and I did most of the runs. I led the end-to-end execution of the full notebook to confirm all 16 cells ran cleanly with no errors before exporting, and I confirmed the outputs matched what we'd seen together earlier. I also added some comments to understand what each code line meant for our group. I also collected every group document and made sure they were in the right format.

Toan Contribution: Our group has reviewed the notebook with the group on different sections. I focused on checking the scatter plot and basic analysis and made sure the outputs were correct. I also handled some comments to help explain the code and helped review the final notebook before submission. I also did the GitHub repository and uploaded files part.

Montserrat Contribution: During the group project, I was communicating with my team members and staying involved in the progress of the project. We discussed different parts of the project and stayed updated on our progress. I reviewed the visualizations and findings to better understand the results. This helped me see how visualizations can make patterns and information easier to understand. Finally, I reviewed and made some changes to the font size and name of the document.
